Summary

Product-minded software engineer (B.Tech CSE, 8.87 GPA) with 1.5+ years building UPI payment systems and scalable Go (Golang) backends in production, including REST API design, database schema design, and integrations with PSPs and NPCI. Owns features end-to-end from design to production, fixes reliability and performance issues at scale, and builds AI/LLM tools that let AI agents investigate production issues.

Skills

Languages: Go (Golang), C++, TypeScript, JavaScript, SQL
Fundamentals: Data Structures and Algorithms, REST API design, database schema design
Backend: Node.js, Express, REST APIs, WebSockets, microservices, API integrations
Databases: PostgreSQL, MySQL (Amazon Aurora), Redis, ProxySQL
Cloud & DevOps: AWS (EKS, SQS, SNS), Docker, Kubernetes, CI/CD
AI / LLM: OpenAI APIs, Retrieval-Augmented Generation (RAG), vector embeddings, MCP-style AI tooling
Frontend & Mobile: React, Next.js, React Router 7 (server-side rendering), Zustand, React Query, TailwindCSS, Android

Experience

KreditBee January 2026 – Present
Software Engineer (Full-Stack, UPI Team) Bangalore, India

- Designed and built NPCI's **UPI Tap & Pay** end-to-end across **Android**, **Go (Golang)** backend, **React** frontend and database schema, enabling NFC payments at POS terminals without internet on the user's phone. Shipped as an NPCI launch partner.
- Built **Mandate Interoperability** end-to-end, enabling users to transfer existing UPI mandates from other payment apps into KreditBee.
- Investigated logs and code to find and fix a **primary-replica lag** issue: replica reads occurred before recent writes were replicated. The issue had affected approximately **48,000 users over 1.5 years**. Built a **ProxySQL** simulator of the production Aurora writer/reader setup with configurable lag to reproduce these failures locally.
- Built **MCP-style AI debugging tools**: KubeSense and Redash CLIs over internal inspection and query APIs, plus a production proxy. Enabled AI agents to investigate production issues, cutting debugging time for the 10-person UPI team from approximately **2 hours to 10 minutes**. Built a tool to detect undocumented changes in PSP APIs.
- Diagnosed and fixed a **Google Ad ID token-invalidation** bug that caused every transaction to fail for approximately **600–700 users per day**, plus **300–400 daily UPI Lite registration failures**.
- Built the **Dynamic Cohort** engine for risk decisions, rewards and nudges. Enabled risk, rewards and marketing teams to define cohort rules themselves, replacing a custom engineering build for every new cohort.
- Implemented **Silent Mobile Verification (SMV)** using network-based SIM verification through a PSP and telecom aggregator, removing user action from verification. Refactored the **onboarding experience** to reduce drop-offs.

Frontpage (YC S21) April 2025 – January 2026
Software Engineer Bangalore, India

- Built **EQHQ**, an AI-powered equity research product, from concept to production. Designed a **tree-structured AI chat** with guardrails on **OpenAI APIs** for branching, contextual conversations.
- Built a document ingestion pipeline to chunk annual reports and earnings-call transcripts, generate **vector embeddings**, and extract stock-level insights with page/chunk tracking across **NSE/BSE-listed stocks**.
- Built a **Retrieval-Augmented Generation (RAG)** Q&A chatbot using similarity search and surrounding source context, tracing each insight to its source chunk for grounded answers.
- Led migration to **React Router 7** with **server-side rendering (SSR)**, **Zustand** and **React Query**, reducing page load time from approximately **1 second to 300–400 milliseconds** and reaching **98+ Lighthouse** scores.
- Integrated **Amplitude Analytics and Session Replay**, giving the team visibility into user sessions and UX drop-offs.
- Deployed EQHQ on **Kubernetes**, led **PostgreSQL** schema design, and migrated the Kubernetes setup to a new account.

Projects

CineStream – Curated movie platform (GitHub) *React Router 7, Node.js, FFmpeg, HLS, PostgreSQL, Cloudflare R2*

- Built movie discovery and related-content recommendations, with **FFmpeg** video processing into **HLS** for adaptive streaming and secure authentication.

Wallet App (GitHub) *React.js, Express.js, Next.js, Prisma, Docker, NextAuth, Turborepo, Zod*

- Built a **Turborepo** monorepo for parallel tasks and faster builds, with a **CI/CD** pipeline for automated testing and **Docker** deployment.

Education

Vellore Institute of Technology Sept 2021 – July 2025
B.Tech, Computer Science and Engineering (GPA: 8.87)
